TOP 3 PAIN POINTS — RANKED BY BUSINESS IMPACT

#1 HIGHEST IMPACT	Cross-Location Parts Inventory Visibility Estimated \$15,000–\$20,000/month in lost revenue from inventory imbalances (Dana’s figure). Highest strategic dollar value; affects corporate P&L; directly. Customer Need A consolidated view of parts stock across all 62 locations, with alerts when inventory is imbalanced between nearby stores. Who It Serves Dana Reeves (Director of Operations) · Corporate ops team Definition of Done Ops team can see stock levels for ~300–500 SKUs across all locations in a single view; configurable alerts fire when a store is critically over/understocked relative to nearby locations; data is accessible via Looker API/export.
#2 HIGH IMPACT	Real-Time Ticket Aging & Turnaround Dashboard Highest daily-use frequency among regional staff. Unresolved tickets beyond 48 hrs indicate broken workflows (parts delays, tech errors, customer no-shows) — early visibility prevents escalations. Customer Need A live, mobile-friendly dashboard showing open repair tickets bucketed by age (0–24 hrs / 24–48 hrs / 48+ hrs) across all locations, color-coded for fast triage. Who It Serves Marcus Brown (Regional Manager) · Regional managers driving between stores Definition of Done Dashboard loads on mobile; ticket aging buckets match Marcus’s green/yellow/red spec; regional managers can filter by store or region without exporting CSVs; refreshes in near-real-time (not batch).
#3 QUICK WIN	Automated Customer Repair-Status Notifications Lowest build cost — feature partially exists in RepairQ today. Reduces inbound ‘where’s my phone’ calls; Dana estimates 20% call reduction frees counter staff for more repairs. Fast ROI with near-zero dev effort. Customer Need Automatic SMS to customers when their repair is complete, ideally including an estimated completion time. Who It Serves Sarah Kim (Franchise Owner, 3 locations) · Counter staff · End customers Definition of Done SMS fires automatically on ticket status change to ‘complete’; message optionally includes estimated ready-by time if field is populated; feature is enabled per-store via RepairQ settings (already exists — Sarah needs onboarding, not build).

CONTRADICTIONS & OPEN QUESTIONS

Topic	Finding
Priority conflict	Dana, Marcus, and Sarah each named a different #1 priority. Dana later softened to accepting a combined turnaround + parts MVP, but no formal consensus was reached. Requires sign-off before scoping.
Notifications: build vs. configure	Sarah’s ‘pain point’ is already solvable today via RepairQ settings (Marcus confirmed). Josh committed to onboarding her this week. This should be closed out-of-band — it is not a product requirement.
SKU count discrepancy	Dana estimates 400–500 SKUs; Marcus says ~300 active. Actual catalog size affects data model design and UI performance. Needs a pull from RepairQ before architecture is finalised.

Estimated completion time field	Dana and Sarah both want ETA in notifications and reporting, but Marcus confirmed no such field exists in RepairQ today. This is net-new data capture — requires tech scoping and workflow change for techs.
Looker integration scope	Dana wants data to flow into the existing Looker instance; Marcus is indifferent. Unclear whether this means a direct DB connection, a data export/API, or a webhook. Integration pattern TBD with Dana's data team.
Transfer orders	Dana asked for the ability to create inter-store transfer orders from the parts view. Josh confirmed this does not exist in RepairQ. Dana agreed to defer to Phase 2, but it should be explicitly logged to avoid scope creep in Phase 1.

WHAT WE WOULD NOT BUILD (AND WHY)

Not Building	Rationale
Inter-store transfer orders (Phase 1)	New capability not in RepairQ; high complexity, not validated beyond one request from Dana. Explicitly deferred to Phase 2 by the customer. Including it now risks delaying the higher-ROI visibility features.
Standalone reporting tool (separate from Looker)	Dana's team already uses Looker for financial reporting. A siloed dashboard with no Looker integration would create parallel workflows and adoption resistance. Build the data layer; let Looker handle deep analysis.
Estimated completion time engine (Phase 1)	Requires new data fields, tech workflow changes, and potentially ML/heuristic modelling. Valuable, but it is a dependency — not a deliverable — for Phase 1 notifications and reporting. Scope separately.
Single sign-on / multi-location login	Sarah raised this but Josh confirmed it is already on the product roadmap. This is a platform-level concern, not a feature to be built within this engagement. Re-routing to the roadmap keeps scope clean.

Non-functional requirements noted: SOC2 certification required (confirmed by Josh); mobile-responsive UI mandatory; data volume ~8,000–10,000 tickets/month peaking Q1.
